- AB - J09157508 New polyester resin aqueous dispersion includes fine particles consisting of 5-99 wt.% of a polyester resin obtained from a polycarboxylic acid containing 1-100 molecular % of a cyclohexene dicarboxylic acid and a polyhydric alcohol and 95-1 wt.% of a resin obtained by polymerising a monomer bearing an ethylenically unsaturated bond as dispersoid. Also claimed is a manufacturing method for the polyester resin aqueous dispersion.
- USE - The polyester resin aqueous dispersions are useful for paints, water-based paints, paper coating materials and film coating materials, especially suitable for ink recording materials for writing instruments, makers, marking pens, drawing pens, printers, non-impact printers and gravure, flexo and offset printing.
- ADVANTAGE - Ink, i.e. the coloured polyester resin aqueous dispersions can give quality image recording and printing and have high can stability and reliability.
